Description

Points 1-2: The Patented Equal-i-zer Hitch Head

The patented Equal-i-zer hitch head creates two powerful points of rotational friction that work to stop side-to-side sway before it starts. The sway control is activated by downward pressure from the trailer tongue and upward pressure on the spring arms. The spring arms link the hitch head to the sway control brackets and distribute trailer tongue weight. The tension of the hitch head pinching the two spring arm sockets are the points of friction that effectively hold the trailer in line behind the tow vehicle and combat sway.

Points 3-4: Rigid Trailer Brackets

The Equal-i-zer hitch's unique rigid bracket design provides two additional integrated friction sway control points. These friction points are activated by loading the spring arms. The Equal-i-zer's rigid brackets eliminate the unwanted side-to-side spring bar movement. Equal-i-zer's original design, combined with the stability added by the rigid brackets, makes it the best protection for your journey.

Our Integrated 4 Point Sway Control provides the highest level of resistance against sway. There is no other hitch on the market that offers as much sway control as the Equal-i-zer.
