Description

The rugged HD2 snow plow blade is reinforced with 10 vertical ribs welded into a rigid framework, which provides additional structural support and torsional strength, even under heavy load.

A standard high-carbon steel cutting edge provides increased wear resistance.

We produce our own hydraulic system to ensure the highest standards of performance, quality and reliability, giving you a plow that is fast, responsive and built to last. All critical hydraulic components are fully enclosed for protection from the elements.

Our industry-leading trip-edge design protects you and your equipment when encountering hidden obstacles. For improved efficiency and less cleanup, only the bottom edge trips, keeping the blade upright and plowed snow in front of the blade.

The FISHER trip edge uses compression-type springs that never require adjustment and will not wear out like extension springs.

Isolation Module

An underhood module transfers lights from vehicle to plow automatically and improves system reliability by using plug 'n play, sealed electrical connections that comply with OEM requirements. Isolating the plow's electrical system from the vehicle's prevents the potential of electrical system damage in the event of a shorted circuit.

Minute Mount 2 Snowplow Mounting System

The reliable, mechanical attachment design of the Minute Mount 2 snowplow mounting system allows for easy hook-up with no tools required and no electrical switches to fail and leave you struggling out in the cold
